

Truss Jib

Truss Jibs - A truss jib is actually utilized to be able to carry and place trusses. It is actually an extended jib additional part which is equipped with a triangular or pyramid shaped frame. Usually, truss jibs are mounted on machines like for instance a compact telehandler, a skid steer loader or a forklift utilizing a quick-coupler attachment.

Older cranes have deep triangular truss jibs which are assembled from standard open structural shapes which are fastened making use of rivets or bolts. On these style jibs, there are few if any welds. Each riveted or bolted joint is susceptible to rust and therefore needs frequent maintenance and check up.

Truss jibs are made with a back-to-back arrangement of lacing members separated by the width of the flange thickness of another structural member. This particular design can cause narrow separation amid the flat surfaces of the lacings. There is limited access and little room to clean and preserve them against corrosion. A lot of rivets loosen and corrode within their bores and should be changed.
