

Forklift Fork Positioner

Fork Positioner for Forklifts - The fork positioner is a hydraulic device which allows the individual driving to be able to work the forklift without leaving the seat. They are made out of high quality materials and are meant to withstand the most demanding procedures and work surroundings. Side shifting models have the added ability to laterally position the arms or the entire load so as to facilitate much more exact carrying and position in a faster and much more efficient manner.

The fork pocket is quite unique and could enable the one operating it to securely swing the forks into position without any fear of destroying the positioning cylinders. This can allow the operator the choice to be able to execute simultaneous or independent fork movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are required. Standard OEM carriages could be converted into fork positioners on existing units.
